

The marks and feedback for Statistical Inference are now available. There is a [step-by-step guide on how to access this here](#). (Steps 1 - 3 apply, feedback given as text within the results area)

We encourage you to carefully review the feedback provided, which has been shared well ahead of the 20-day window to help you gain the most benefit. Please use these comments to support your progress in future assessments.

If you want some tips on how to turn your feedback into action [have a look at this guide](#).

The marks have been checked and internally moderated – note that all marks remain provisional until ratified at field board.

Frequently asked questions

“What was the average mark?”

The median mark for the assessment was 55%.

Overall, well done. Many of you provided valuable insight for the client, and demonstrated principles of reproducible research.

"What is the most important piece of feedback from the assessment?"

Many of you risked potential assessment offences by not citing generative AI use. In future assessments, remember to provide a statement of which AI tools you are using and for what purposes. Clearly, many of you are grappling with the extent to which you should use generative AI:

- Generative AI must be referenced if used, **with details of where and how used.**
- Generative AI should not be your starting point with any problem.
- You should learn the fundamentals of R coding and statistical inference using traditional methods first. Try techniques yourself, maybe ask for help from peers. Embrace the ‘struggle’ as part of the learning process.

Attempt interpretations in your own words, and have self-belief in your abilities.

- There is a rise in AI 'workslop' in industry; this is reflected on this module. To overcome 'workslop', you should avoid over-reliance on generative AI. No-one wants to read emails and other work written mostly by robots.
- Break problems down into smaller steps. When consulting generative AI do so in small steps, so that you can learn from the responses. Make sure you understand the response fully. Avoid feeding large problems into generative AI as that will likely create large volumes of output that will not help you learn and will likely include 'workslop'.

Useful reading:

[AI 'workslop' is creating unnecessary extra work. Here's how we can stop it](#)

What does 50% mean at UWE (Level 7)?

At UWE Bristol, Master's degrees are taught and assessed at Level 7. Under UWE Academic Regulations, the pass mark for Level 7 modules is 50%. This means:

- 50–59% = Pass
- 60–69% = Merit
- 70%+ = Distinction

A mark of 50% means you have met the learning outcomes at Master's level. It shows that you have demonstrated appropriate postgraduate knowledge, understanding, critical engagement, and application.

The pass threshold is higher than at undergraduate level (40%) because Master's study requires greater independence, analysis, and academic judgement.

At Level 7, it is normal for the most common mark to be 50%. This happens because most students meet the learning outcomes, while fewer exceed them to Merit or Distinction level. Very high marks are reserved for work that goes well beyond the required standard.

There is no expectation that most students should achieve Merit or Distinction.

Students often compare their Master's marks to their undergraduate results. This comparison is misleading. At undergraduate level, marks of 60–70% are

relatively common. At Master's level, marks are awarded more conservatively because the standard is higher.

If your marks are 50% +, you are passing and meeting the Level 7 learning outcomes. A cohort where the mode is 50% is academically appropriate at Master's level.

This is a 15 credit module, for how this impacts your degree classification see:

<https://www.uwe.ac.uk/study/academic-information/degree-classifications>

Why do some students have feedback comments from multiple markers?

As part of the internal moderation processes that have been followed, a sample of students were selected for double marking.

Can my work be remarked / marked by an additional marker?

Please note that we can only review a mark if an error is made (e.g. recording a mark of -1). We cannot review the mark, remark, or provide an additional marker, when marks are based on academic judgement.

Please note that the marking:

- o has been internally moderated,
- o before it is agreed at the field board it will be moderated by our external examiners and, should there be any concerns with the marking, then this would be noted at the field board, and any required changes to the marks would be made at that point.
- o All marks are provisional until they have gone through the pre field board external scrutiny.

What if I received a mark less than 50 or did not submit?

There will be a resit opportunity in the summer. We do not know the date – this will be set by the exam timetabling team nearer the time.

Advice for resit:

- Include clear statement of any generative AI use (and see above guidance on generative AI usage).
- Take time to learn the basics and do them well without over-reliance on generative AI.
- There may be a misconception that you are required to produce complex analyses that you may not understand – this usually results in poorly structured, non-concise, irrelevant, lower quality work. Complex statistical techniques and visualisations that we do not teach are not required – if used you should provide clear justification and references.
- See the document in the module information titled ‘What do I need to do to pass Statistical Inference’.
- Include in your submission the .rmd file for reproducibility (and do not edit the knitted Word document).
