

Statistical Inference EXAM FEEDBACKS

Your data preparation shows some adherence to principles of reproducible research. You took a systematic approach to cleaning and preparing the dataset, with all decisions justified appropriately. Some of the data preparation and exploration was repetitive (for example, you did not need to produce a boxplot for age before and after cleaning; the mosaic plot is not necessary for cleaning the data) so I encourage you to think about how to be concise when explaining your data preparation steps.

For the core research question, I would again encourage you to be precise. The limit was 500 words for the report. You could, for example, remove the plots of the dependent variable, as plots of the model residuals are more informative.

There is a serious gap in your explanation of how you selected your model. You said that Rating was weakly correlated with Spend, when the correlation is very strong at 0.84. You identified BrowsingTime and DeliveryTime as the main predictors, but then put all predictors in the model. Hence the model has predictors that are not significant – approaches given in module materials e.g. AIC have been overlooked. You interpret the R^2 value but not the model coefficients. Basic but not full discussion of model assumptions and limitations.

Your own research question is unoriginal: you have already assessed a relationship between BrowsingTime and Spend in the core research question. You do not justify why you are conducting both correlation and simple linear regression in your statistical analysis plan. Hypotheses are stated but there is confusion over the methods and no conclusion is given with regard to the null hypothesis. Again, the report lacks conciseness, being 50% longer than the expected 500 words.

You are expected to explain and reference any tools used in preparation of your submission.
